## AI Prompt Generator

### Multi-Model Evaluation

This workflow takes a user's goal and generates the best possible prompt by running it through 3 specialized AI agents in parallel, then evaluating all outputs to pick the winner.

**Flow:**

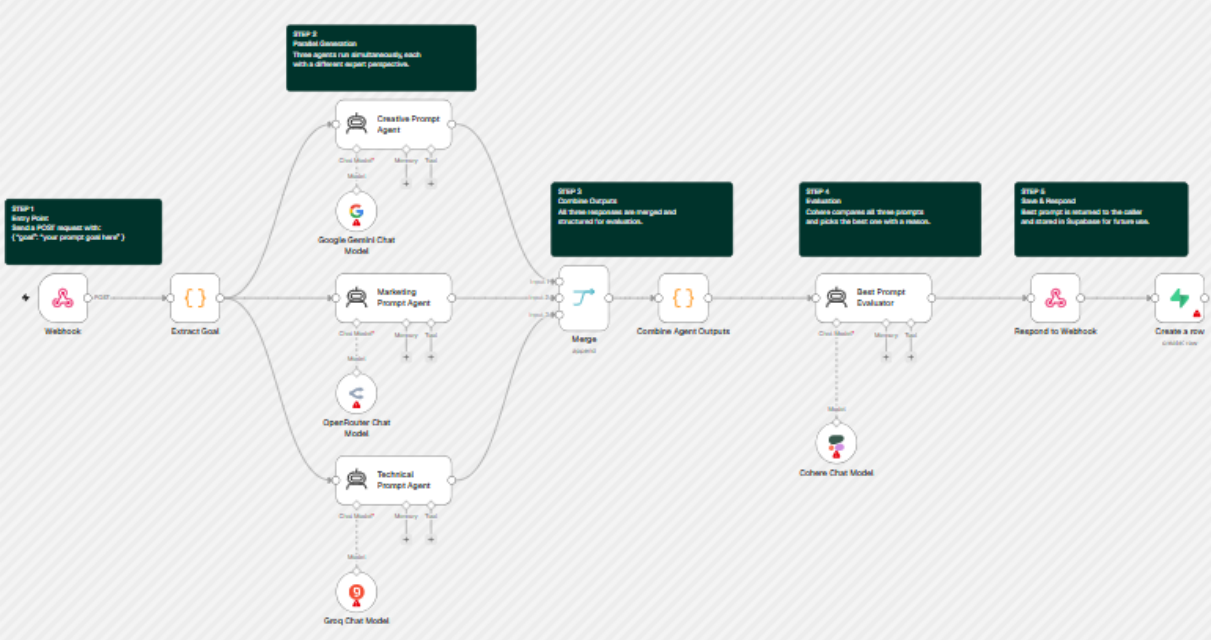

1. Webhook receives a POST request with { "goal": "..." }
2. Three agents process it simultaneously:
   - Creative Agent (Gemini) --> storytelling & viral ideas
   - Marketing Agent (OpenRouter) --> engagement & conversions
   - Technical Agent (Groq) --> precision & AI optimization
3. All outputs are merged and sent to an Evaluator (Cohere)
4. Best prompt is returned via webhook + saved to Supabase

**Required credentials:**

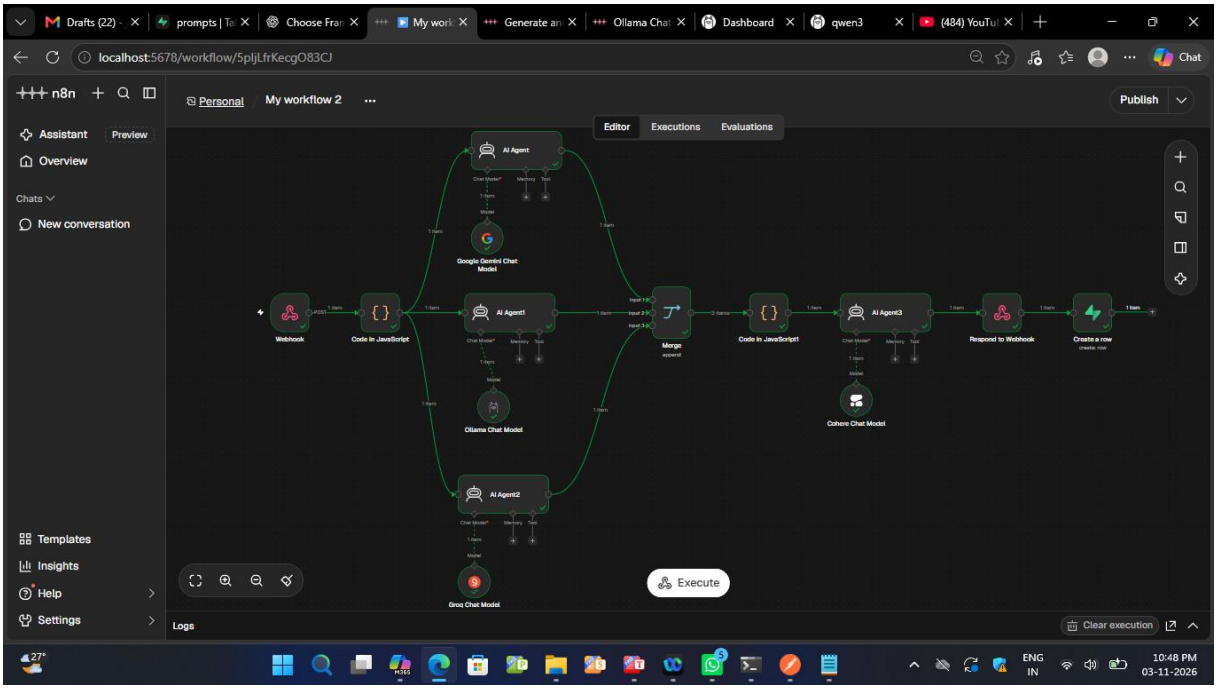

- Google Gemini API
- OpenRouter API
- Groq API
- Cohere API
- Supabase (table: prompts | columns: goal, best_prompt)

**Note: I used the same nodes that were used in the selected template. Instead of the OpenRouter Chat Model, I used the Ollama Chat Model since OpenRouter was asking for payment.**

**Screenshot of the workflow taken from n8n templates page:**

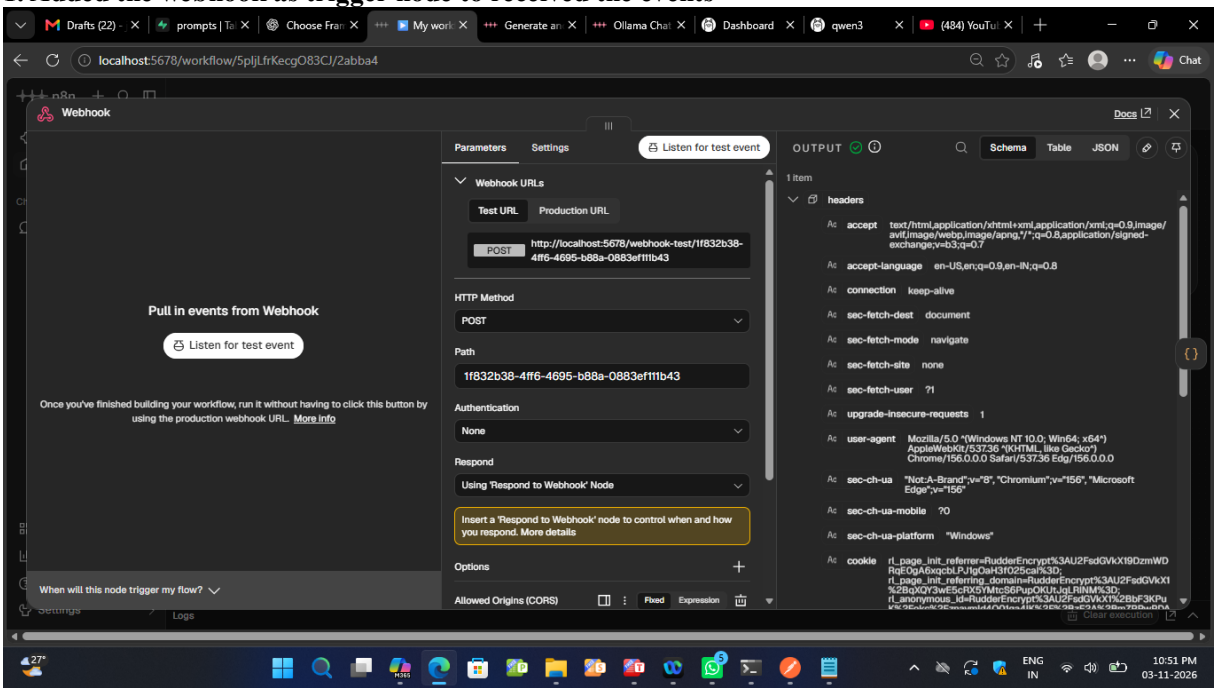

**Screenshot of the workflow implemented:**

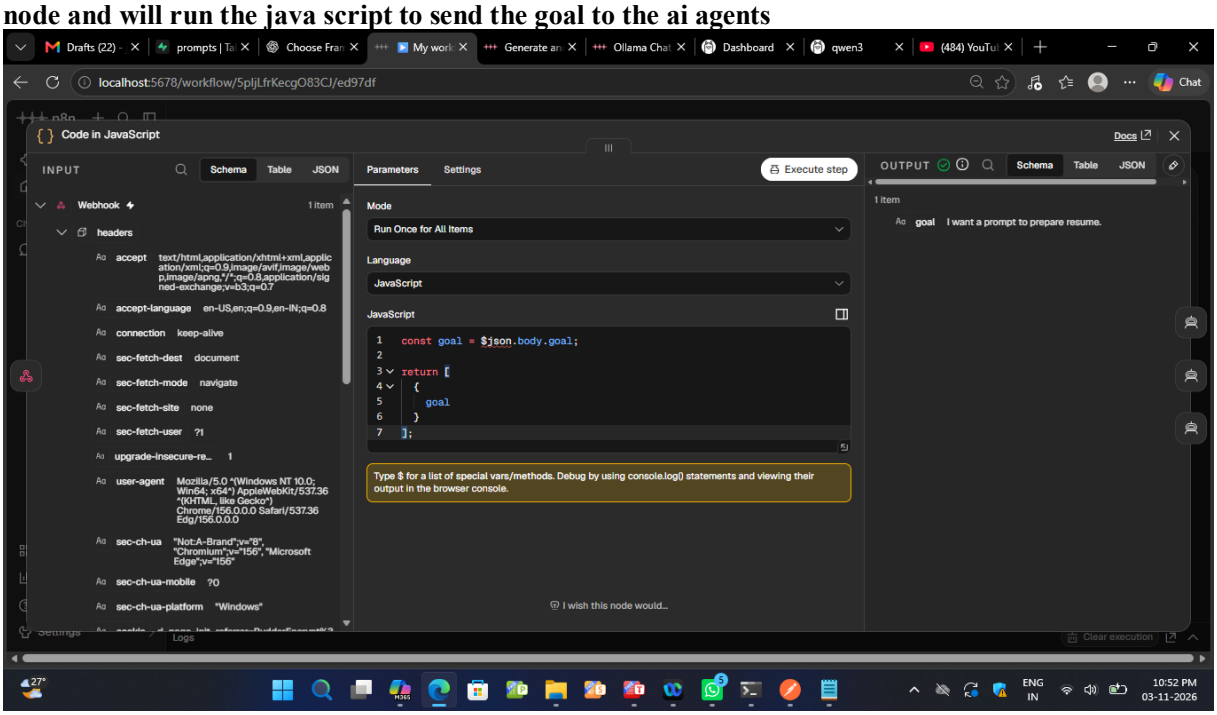

**Steps followed:**

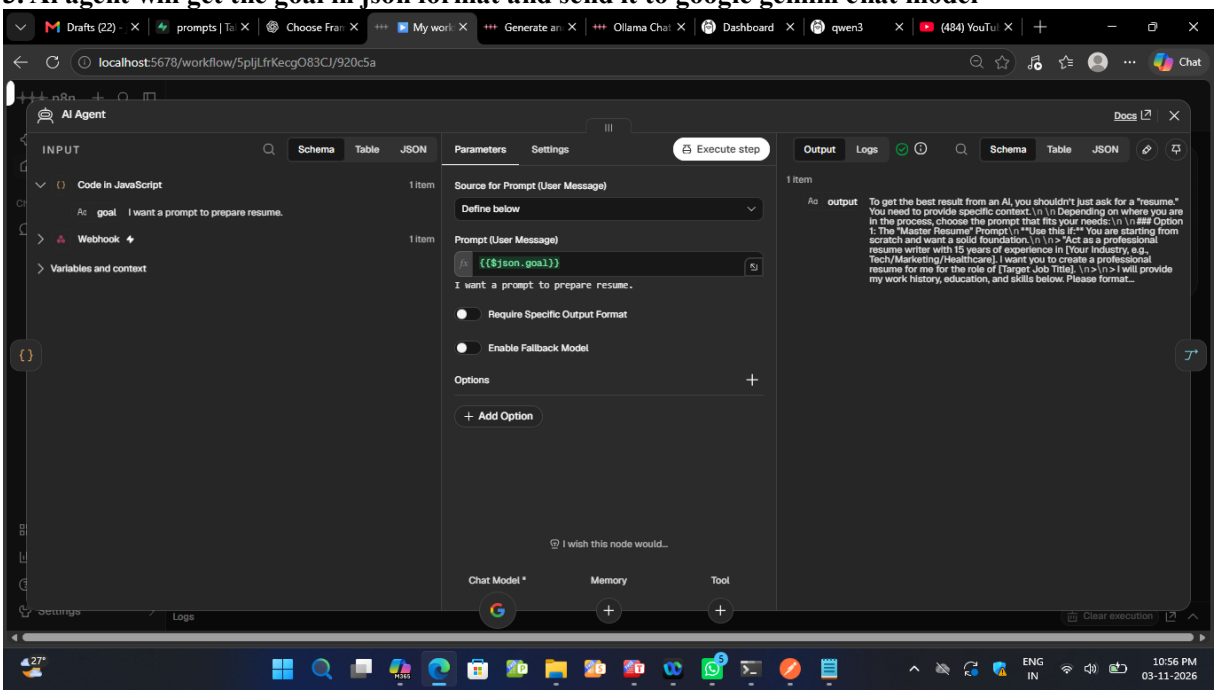

**1. Added the webhook as trigger node to received the events**

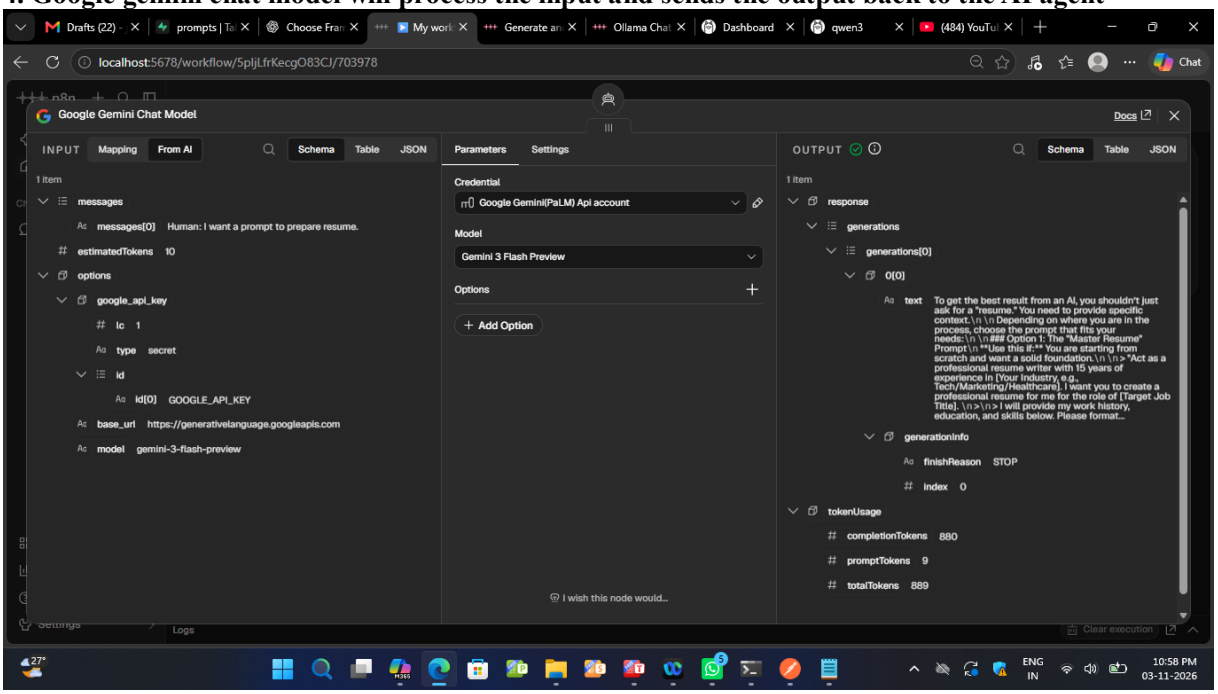

**2. Added the code node and connected to the trigger node. This node will receive the goal from trigger node and will run the java script to send the goal to the ai agents**

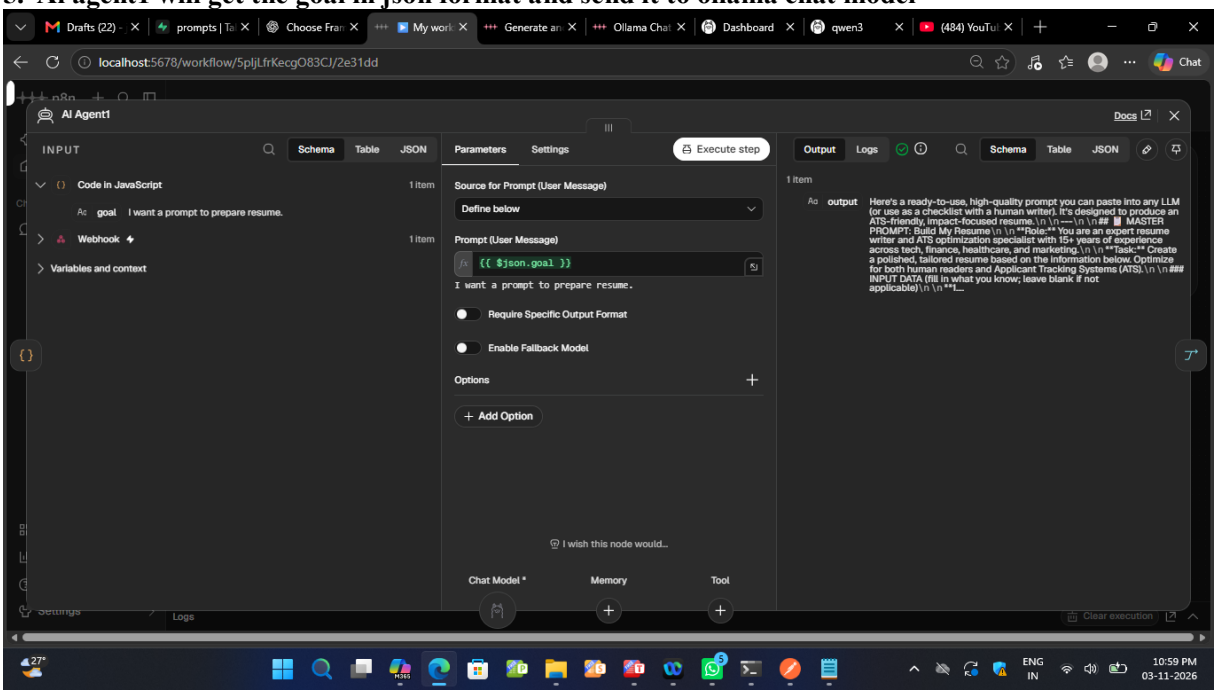

**3. Ai agent will get the goal in json format and send it to google gemini chat model**

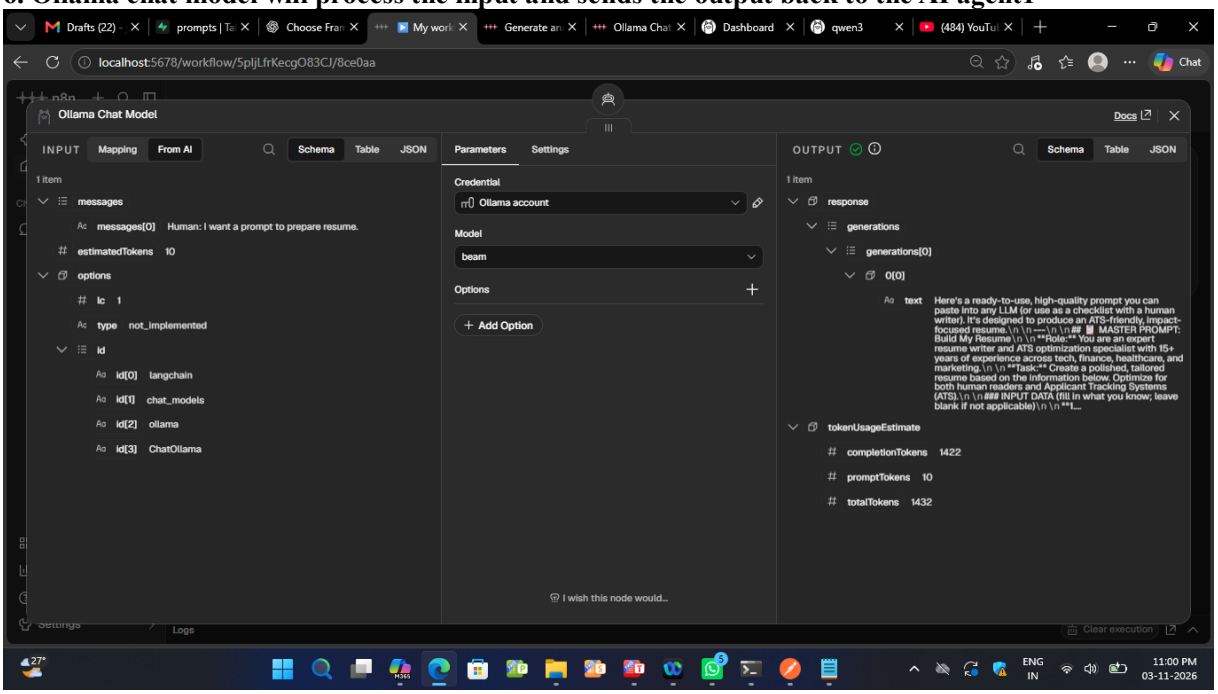

**4. Google gemini chat model will process the input and sends the output back to the AI agent**

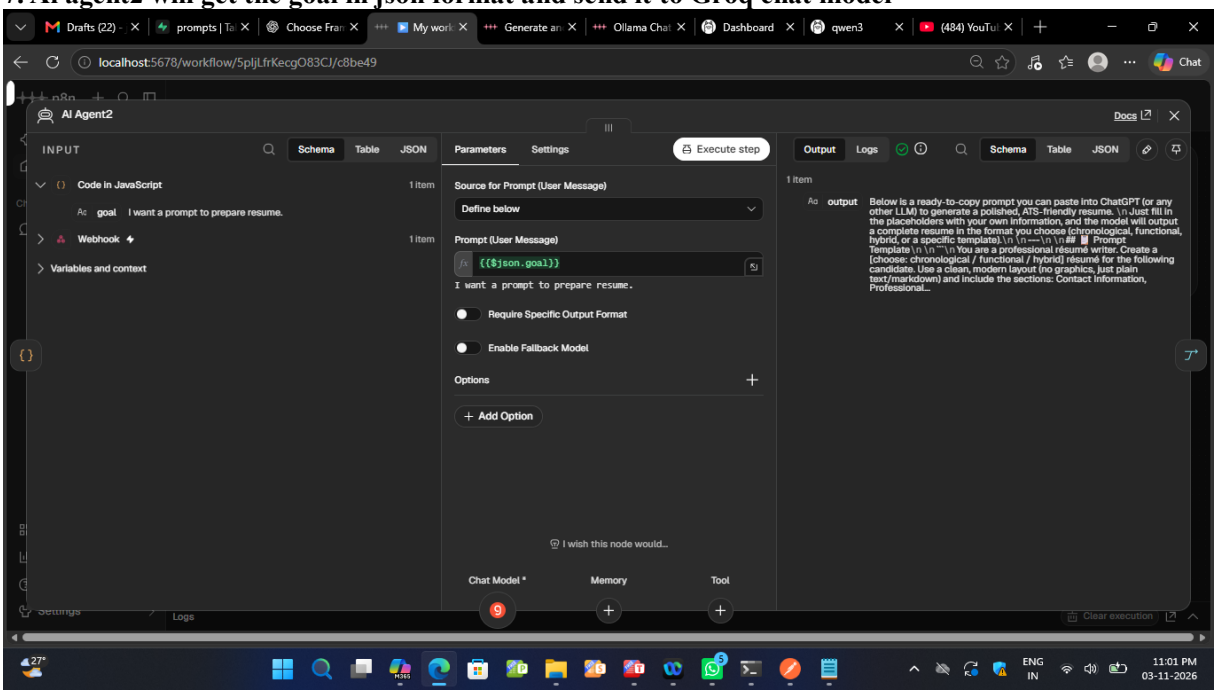

**5. Ai agent1 will get the goal in json format and send it to ollama chat model**

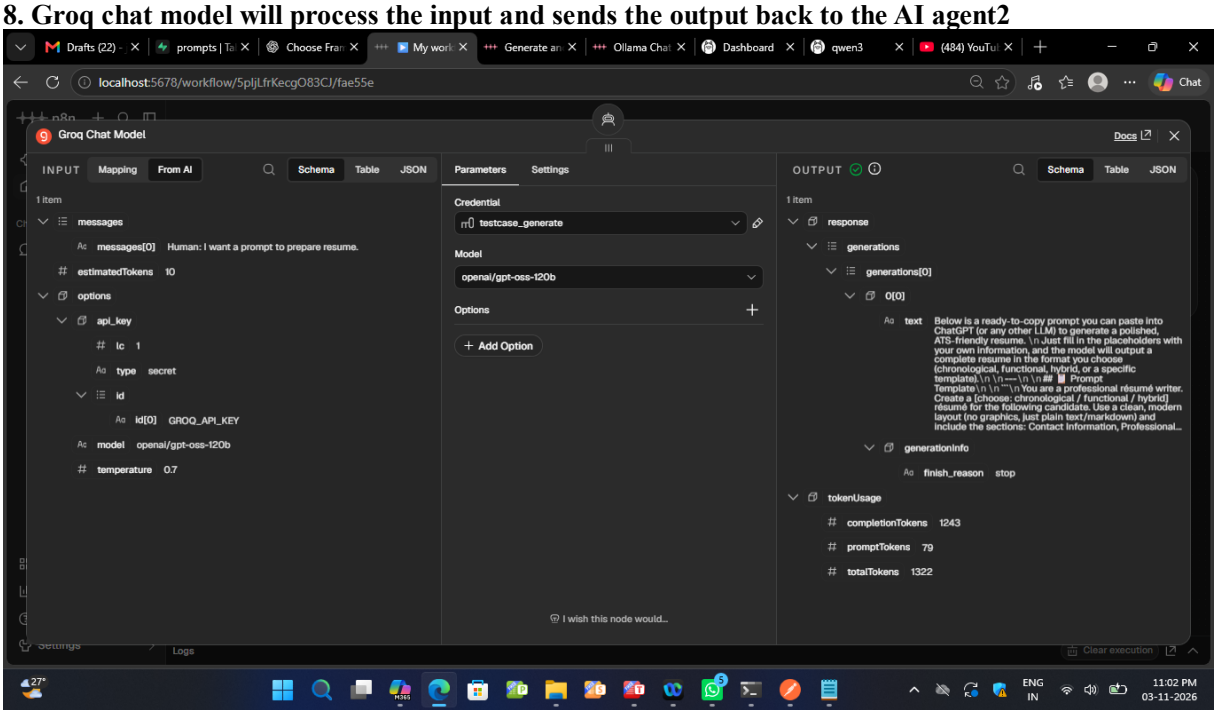

**6. Ollama chat model will process the input and sends the output back to the AI agent1**

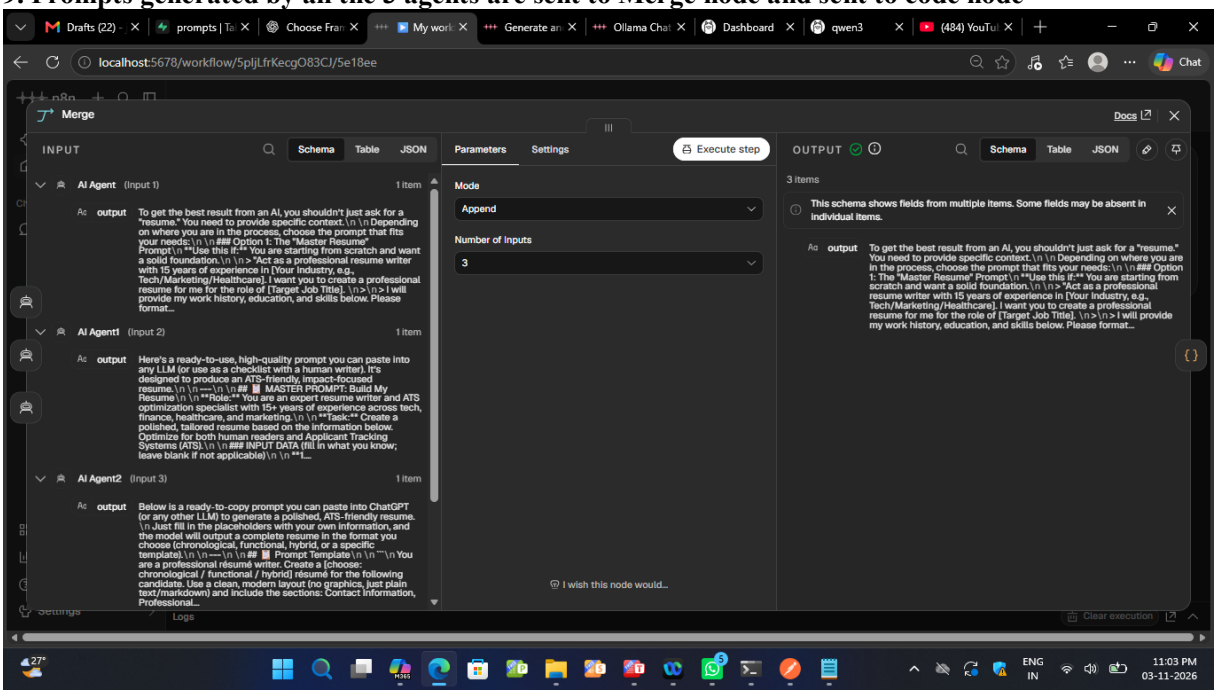

## 7. Ai agent2 will get the goal in json format and send it to Groq chat model

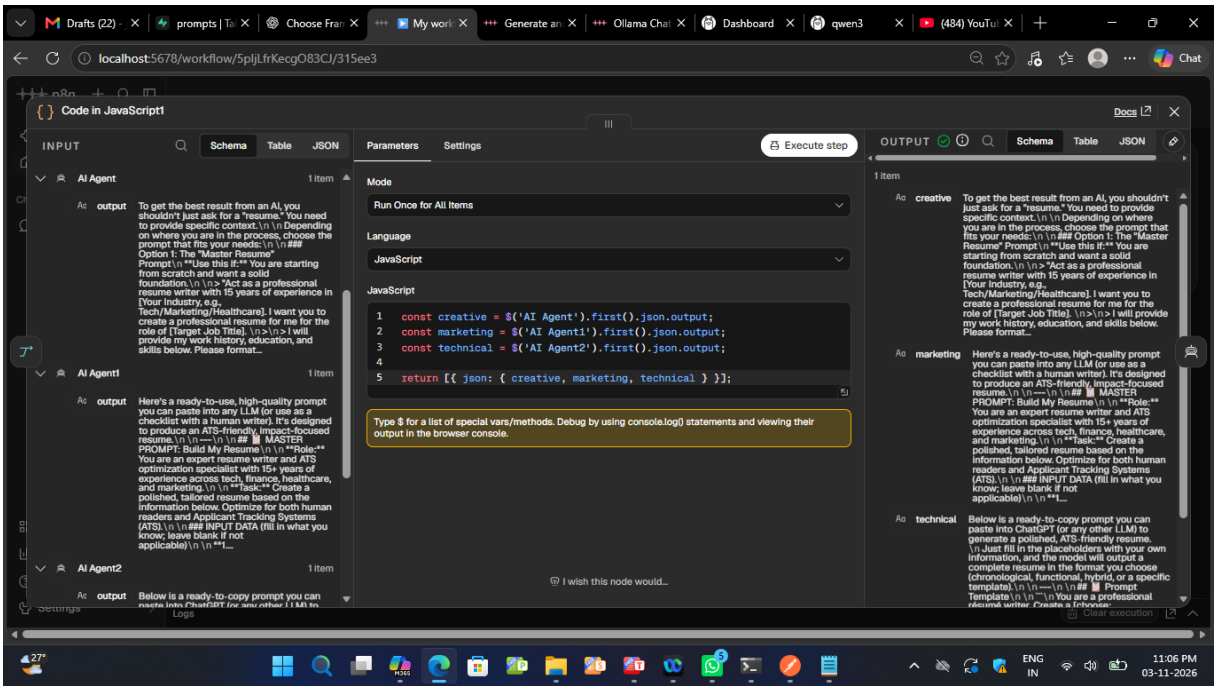

## 8. Groq chat model will process the input and sends the output back to the AI agent2

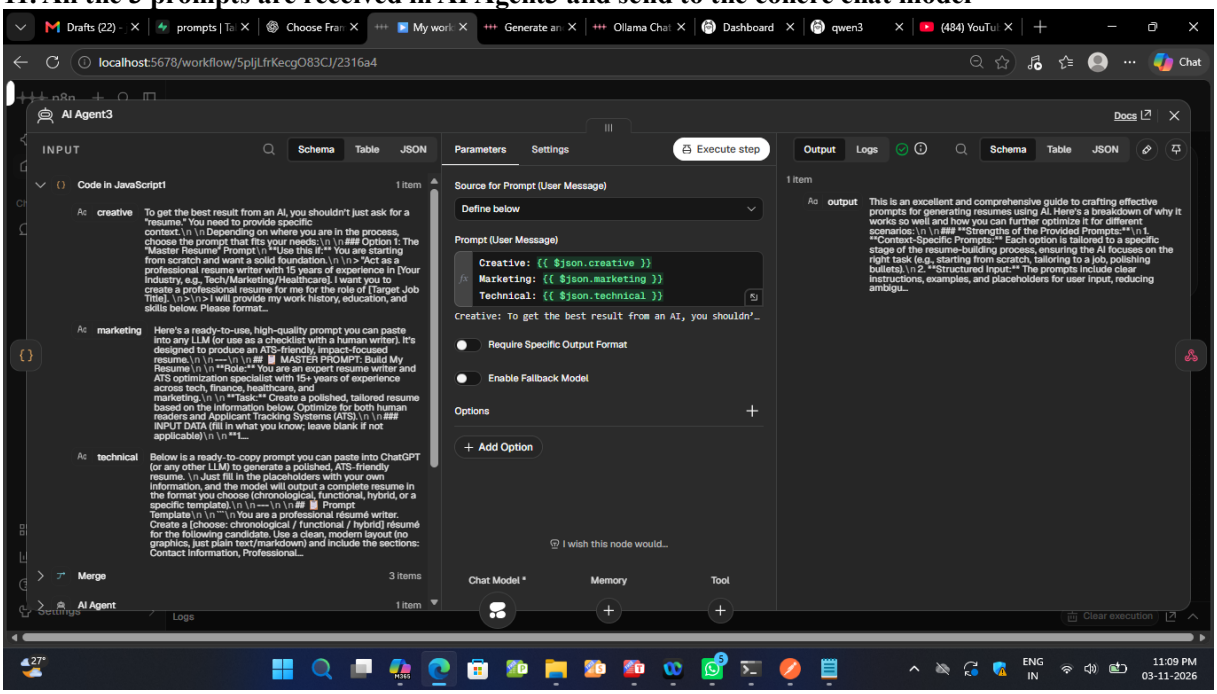

**9. Prompts generated by all the 3 agents are sent to Merge node and sent to code node**

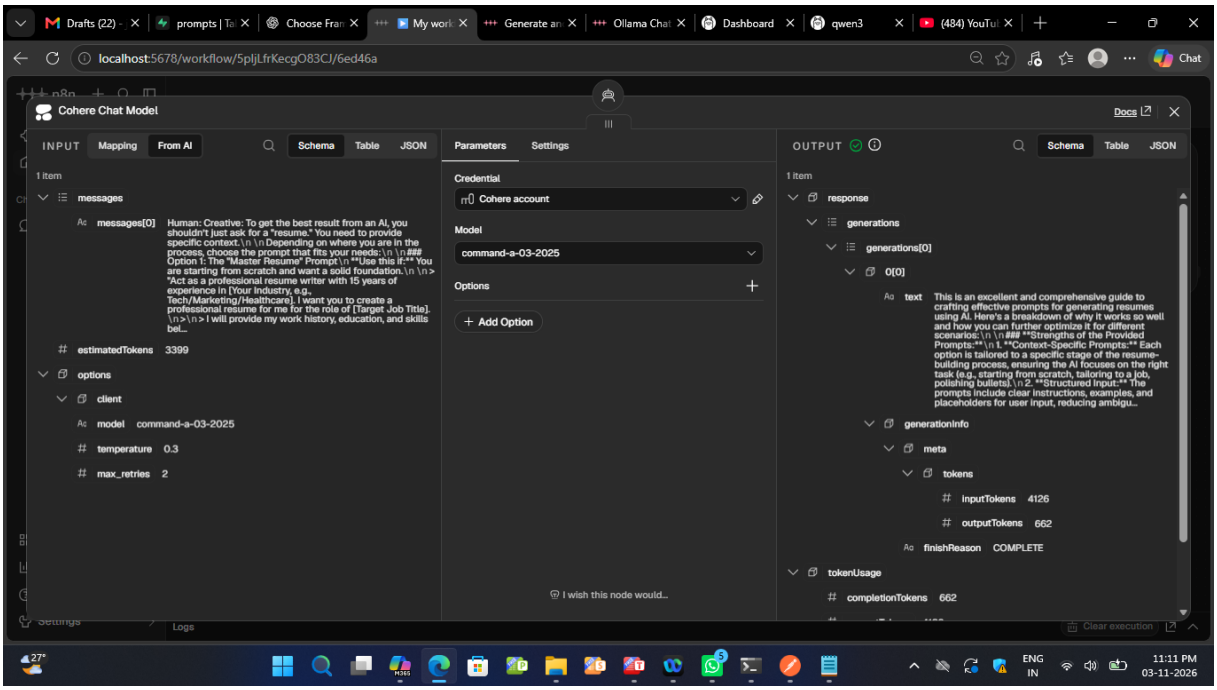

**10. All the 3 prompts are sent to AI Agent3 from code node**

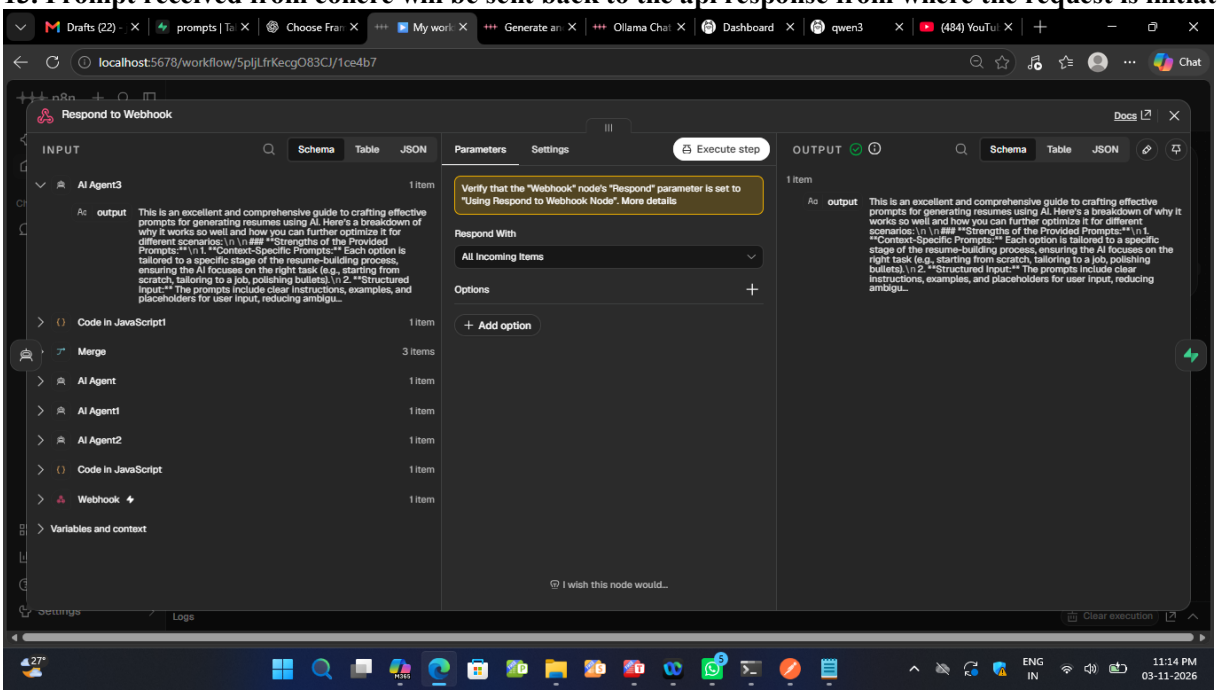

**11. All the 3 prompts are received in AI Agent3 and send to the cohere chat model**

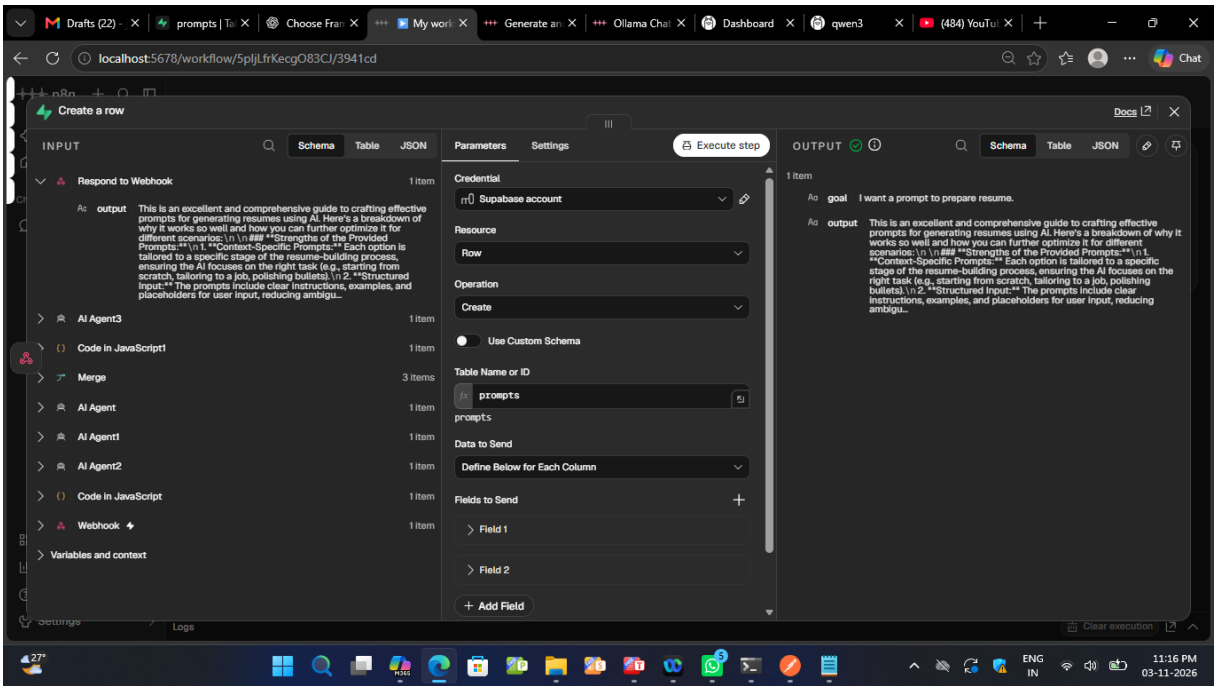

**12. Cohere chat model process all the 3 prompts and generates the better one**

**13. Prompt received from cohere will be sent back to the api response from where the request is initiated**

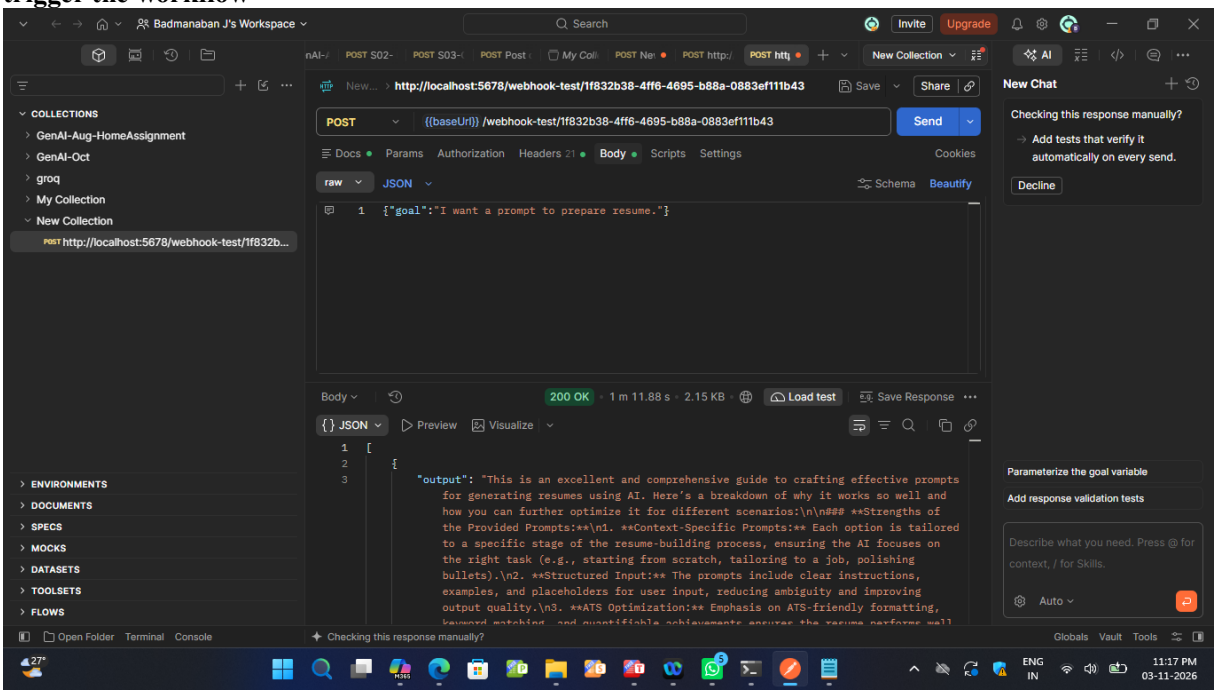

**14. Generated prompt will be saved to the database table prompts**

**PreConditions followed:**

**1. Used postman to send the goal in the api request and the same will be received in the trigger node to trigger the workflow**

**2. Created the account in Supabase and created the table prompts followed by the project creation.Here two columns are created , column goal is used to save the goal which is sent by the user. Column output is used to save the final prompt given by the Cohere chat model**
